SUMMARY

Full-stack developer with close to two years shipping production TypeScript: Next.js, Nuxt and React over .NET Core, Spring Boot and Supabase back ends. I own features from schema design through deployment, and I am at home in the infrastructure layer too, with Docker, Terraform, Azure and a Kubernetes cluster I run myself. Bilingual FR/EN.

EDUCATION & LANGUAGES

College Diploma, Computer Science Technology | CÉGEP André-Laurendeau

2026

Languages: French and English (professional working proficiency in both)

EXPERIENCE

Freelance Developer | Services Conseils Sensoroli Inc.

Contract · Jul 2026 – Aug 2026

Angular · TypeScript · C# / .NET Core · SQL Server · Azure · Terraform

sensoroli-consulting.net

Delivered two projects end to end for a Montréal IT consulting firm as sole developer: a Quebec payroll tax engine and a bilingual corporate site.

- Built a payroll tax calculator (QPP, EI, QPIP) that replaced the client's QuickBooks workflow: an Angular front end in TypeScript, HTML and CSS over a C# / .NET Core REST API, with an EF Core data layer, a SQL Server schema designed from scratch and XUnit tests covering the tax rules.
- Consolidated separate front-end and back-end deployments into a single Azure Container App backed by Azure SQL, halving hosting costs and removing a cross-service network hop.
- Provisioned the Azure Static Web Apps infrastructure in Terraform for a bilingual (FR/EN) landing page, making environments reproducible instead of hand-configured.

Full-Stack Developer Intern | EnJoySocial

Dec 2024 – May 2026

Nuxt · Vue · React Native · Supabase · PostgreSQL · Husky · Claude API

enjoysocial.ca

Spent 18 months as an embedded engineer at an early-stage social startup, working across the consumer product and internal tooling.

- Led the mobile-to-web migration of the core product: rebuilt a React Native prototype in Nuxt with an expanded feature set while keeping the Supabase schema intact, so the pivot shipped without a data migration.
- Designed and owned the Supabase/PostgreSQL data layer that both the mobile prototype and the web rebuild ran against, including the access rules covering roughly 400 users.
- Built an internal budget analytics dashboard (ROI, ARPU, burn rate) end to end: data layer, ApexCharts forecasting, and a Claude API chatbot that let non-technical staff query the numbers in plain language, replacing a manual Excel reporting process.
- Set up Husky git hooks and merge-time lint checks, so unlinted code could not reach the shared branch.

SELECTED PROJECTS

Prose | Internship management platform

Sep 2025 – Dec 2025

React · Spring Boot · PostgreSQL · JUnit · Docker · Vercel

prose-jet.vercel.app

- Found and fixed a critical access-control flaw before launch that would have let any authenticated user read another user's records.
- Owned the notification subsystem end to end: PostgreSQL delivery schema, Spring Boot service logic, and the React flow that routes to the right page on click, scrolls to the target element and highlights it.
- Containerized the Spring Boot / PostgreSQL backend in Docker, covered it with unit and integration tests in JUnit, and ran deployment for a five-person team across six Agile sprints.
- Led a UI unification effort, consolidating inconsistent components and styles into a shared design system used across the platform.

Next Stitch | Sewing project manager

Jan 2026 – Jun 2026

Next.js · TypeScript · Neon Postgres · NextAuth · Claude API

next-stitch-henna.vercel.app

- Built a multi-user Next.js / TypeScript application from schema to UI: Neon Postgres data model, NextAuth authentication, progress-photo tracking, checklists, and filtering by budget, date and status.
- Integrated the Claude API to draft sewing patterns from written descriptions when no reference photo exists.
- Added a Leaflet / OpenStreetMap view surfacing nearby fabric stores for any searched city.

BiggerWorld | Self-hosted Kubernetes cluster

Feb 2026 – Present

Kubernetes · Flux · GitOps · Docker · Linux

github.com/dev-stacc/BiggerWorld

- Run a production-grade cluster on old hardware I refurbished myself, providing single sign-on, secrets management and observability, administered end to end at no cloud cost.
- Automated every deployment with GitOps via Flux, so infrastructure changes ship straight from a Git commit with no manual steps.

TECHNICAL SKILLS

Core TypeScript, JavaScript, React, Next.js, Node, HTML/CSS, Tailwind, PostgreSQL, SQL

Also work in C# / .NET Core, Vue, Nuxt, Angular, Spring Boot, Java, Python, REST API design, XUnit, JUnit

Data & infra Supabase, Neon, SQL Server, EF Core, Docker, Kubernetes, Terraform, Flux, Azure, Vercel, Linux

Ways of working Git, Agile, CI/CD, unit & integration testing, pre-merge lint checks, Jira, Figma, Notion
