

Sensini Valitiana

Full-Stack Developer

438-836-7181 | s.valitiana@gmail.com | sensini-valitiana.vercel.app | github.com/dev-stacc | linkedin.com/in/sensini-valitiana

EDUCATION

College Diploma in Computer Science Technology | CÉGEP André-Laurendeau

Graduated 2026

SKILLS

Languages: French, English

Programming: TypeScript, JavaScript, HTML, CSS, Python, Java, C#, SQL

Backend: Spring Boot, ASP.NET Core, REST APIs, EF Core, XUnit

Frontend: React, Next.js, Angular, Vue, Nuxt, Tailwind CSS

Databases & Infra: PostgreSQL, Supabase, Neon, SQL Server, Docker, Kubernetes, Terraform, Azure, Linux, Flux

Tools: Git, Agile, DevOps, Vercel, Claude API, Jira, Notion, Figma

EXPERIENCE

Freelance Developer | Services Conseils Sensoroli Inc. | *Montréal, QC*

Jul 2026 – Present

C# / .NET Core • SQL Server • Angular • Docker • Terraform • Azure

sensoroli-consulting.net

Ran two freelance projects for a Montréal IT consulting firm, building a Quebec payroll tax calculator from scratch and a bilingual corporate landing page.

- Developed the C# / .NET Core REST API, SQL Server schema, and EF Core data layer for a Quebec payroll tax calculator (QPP, EI, QPIP), replacing QuickBooks
- Consolidated the backend and frontend into one Azure Container App with an Azure SQL database, halving hosting costs
- Provisioned the Azure Static Web Apps infrastructure via Terraform for a bilingual (FR/EN) corporate landing page

Full-Stack Developer Intern | EnJoySocial | *Montréal, QC*

Dec 2024 – May 2026

React Native • Nuxt • Vue • Supabase • Claude API • Vercel

enjoysocial.ca

Interned at an early-stage social startup across two projects: a gamified social platform and an internal marketing analytics tool.

- Built a prototype in React Native, then rebuilt it with more features in Nuxt after a mobile-to-web pivot, reusing the same Supabase database throughout
- Worked in a small cross-functional team of engineers, designers, and leadership, demoing progress every sprint in an Agile process
- Drove development of an internal budget analytics dashboard (ROI, ARPU, burn rate), building the data layer and Claude API chatbot with ApexCharts forecasting

PROJECTS

Prose | Academic project: internship platform rebuild

Sep – Dec 2025

Spring Boot • PostgreSQL • Docker • React • Vercel

prose-jet.vercel.app

Contributed full-stack to a from-scratch rebuild of our CÉGEP's internship management platform, delivered by a five-person team over six Agile sprints.

- Containerized the team's Spring Boot / PostgreSQL backend in Docker, handled deployment, and caught a critical access-control bug before launch that would have let any user reach another user's records
- Owned the notification subsystem end-to-end, from the PostgreSQL delivery schema and Spring Boot service logic to the React flow that navigates to the right page on click, scrolls to the target element, and highlights it
- Led a UI unification effort across the platform, consolidating inconsistent components and styles into a more consistent design system

Next Stitch | Personal project: sewing project manager

Jan – Jun 2026

Next.js • Neon • NextAuth • Claude API • Leaflet • Vercel

next-stitch-henna.vercel.app

Created a full-stack sewing project tracker to stop losing pattern drafts and progress photos across projects, with multi-user accounts and AI-assisted pattern generation.

- Designed the Neon Postgres schema and wired NextAuth for multi-user authentication in a Next.js / TypeScript application
- Integrated the Claude API to draft sewing patterns from written descriptions when no reference photo exists, alongside progress-photo tracking and checklists
- Added a Leaflet map surfacing nearby fabric stores for any searched city via OpenStreetMap, plus a project filter by budget, date, and status

BiggerWorld | Personal project: self-hosted homelab cluster

Feb 2026 – Present

Kubernetes • Flux • GitOps • Docker • Linux

github.com/dev-stacc/BiggerWorld

Set up a self-hosted Kubernetes homelab on repurposed hardware to operate production-grade infrastructure for personal projects without cloud costs.

- Deployed a cluster providing single sign-on (SSO), secrets management, and observability
- Automated every deployment with GitOps via Flux, so infrastructure changes ship straight from a Git commit
